

1. Two Sum

Given an array of integers `nums` and an integer `target`, return *indices of the two numbers such that they add up to target*.

You may assume that each input would have *exactly* one solution, and you may not use the *same* element twice.

You can return the answer in any order.

Example 1:

Input: `nums = [2,7,11,15]`, `target = 9`

Output: `[0,1]`

Explanation: Because `nums[0] + nums[1] == 9`, we return `[0, 1]`.

Example 2:

Input: `nums = [3,2,4]`, `target = 6`

Output: `[1,2]`

Example 3:

Input: `nums = [3,3]`, `target = 6`

Output: `[0,1]`

Constraints:

- `2 <= nums.length <= 104`
- `-109 <= nums[i] <= 109`
- `-109 <= target <= 109`
- Only one valid answer exists.

2. Add Two Numbers

You are given two non-empty linked lists representing two non-negative integers. The digits are stored in reverse order, and each of their nodes contains a single digit. Add the two numbers and return the sum as a linked list.

You may assume the two numbers do not contain any leading zero, except the number 0 itself.

Example 1:

Input: `l1 = [2,4,3]`, `l2 = [5,6,4]`

Output: `[7,0,8]`

Explanation: `342 + 465 = 807`.

Example 2:

Input: l1 = [0], l2 = [0]

Output: [0]

Example 3:

Input: l1 = [9,9,9,9,9,9,9], l2 = [9,9,9,9]

Output: [8,9,9,9,0,0,0,1]

Constraints:

- The number of nodes in each linked list is in the range [1, 100].
- $0 \leq \text{Node.val} \leq 9$
- It is guaranteed that the list represents a number that does not have leading zeros.

3. Longest Substring without Repeating Characters

Given a string *s*, find the length of the longest substring without repeating characters.

Example 1:

Input: *s* = "abcabcbb"

Output: 3

Explanation: The answer is "abc", with the length of 3.

Example 2:

Input: *s* = "bbbbb"

Output: 1

Explanation: The answer is "b", with the length of 1.

Example 3:

Input: *s* = "pwwkew"

Output: 3

Explanation: The answer is "wke", with the length of 3.

Notice that the answer must be a substring, "pwke" is a subsequence and not a substring.

Constraints:

- $0 \leq \text{s.length} \leq 5 * 10^4$
- *s* consists of English letters, digits, symbols and spaces.

4. Median of Two Sorted Arrays

Given two sorted arrays *nums1* and *nums2* of size *m* and *n* respectively, return the median of the two sorted arrays.

The overall run time complexity should be $O(\log(m+n))$.

Example 1:

Input: *nums1* = [1,3], *nums2* = [2]

Output: 2.00000

Explanation: merged array = [1,2,3] and median is 2.

Example 2:

Input: `nums1 = [1,2]`, `nums2 = [3,4]`

Output: `2.50000`

Explanation: merged array = `[1,2,3,4]` and median is $(2 + 3) / 2 = 2.5$.

Constraints:

- `nums1.length == m`
- `nums2.length == n`
- $0 \leq m \leq 1000$
- $0 \leq n \leq 1000$
- $1 \leq m + n \leq 2000$
- $-10^6 \leq \text{nums1}[i], \text{nums2}[i] \leq 10^6$

5. Longest Palindromic Substring

Given a string `s`, return *the longest palindromic substring* in `s`.

Example 1:

Input: `s = "babad"`

Output: `"bab"`

Explanation: `"aba"` is also a valid answer.

Example 2:

Input: `s = "cbbd"`

Output: `"bb"`

Constraints:

- $1 \leq s.length \leq 1000$
- `s` consist of only digits and English letters.

6. Zigzag Conversion

The string `"PAYPALISHIRING"` is written in a zigzag pattern on a given number of rows like this: (you may want to display this pattern in a fixed font for better legibility)

```
P A H N
A P L S I I G
Y I R
```

And then read line by line: `"PAHNAPLSIIGYIR"`

Write the code that will take a string and make this conversion given a number of rows:
`string convert(string s, int numRows);`

Example 1:

Input: `s = "PAYPALISHIRING"`, `numRows = 3`

Output: `"PAHNAPLSIIGYIR"`

Example 2:

Input: `s = "PAYPALISHIRING"`, `numRows = 4`

Output: `"PINALSIGYAHRPI"`

Explanation:

```
P I N
A L S I G
Y A H R
P I
```

Example 3:

Input: `s = "A"`, `numRows = 1`

Output: `"A"`

Constraints:

- `1 <= s.length <= 1000`
- `s` consists of English letters (lower-case and upper-case), `' '` and `'.'`.
- `1 <= numRows <= 1000`

7. Reverse Integer

Given a signed 32-bit integer `x`, return `x` *with its digits reversed*. If reversing `x` causes the value to go outside the signed 32-bit integer range `[-231, 231 - 1]`, then return 0.

Assume the environment does not allow you to store 64-bit integers (signed or unsigned).

Example 1:

Input: `x = 123`

Output: `321`

Example 2:

Input: `x = -123`

Output: `-321`

Example 3:

Input: `x = 120`

Output: `21`

Constraints:

- `-231 <= x <= 231 - 1`

8. String to Integer (atoi)

Implement the `myAtoi(string s)` function, which converts a string to a 32-bit signed integer (similar to C/C++'s `atoi` function).

The algorithm for `myAtoi(string s)` is as follows:

1. Read in and ignore any leading whitespace.
2. Check if the next character (if not already at the end of the string) is `'-'` or `'+'`. Read this character in if it is either. This determines if the final result is negative or positive respectively. Assume the result is positive if neither is present.
3. Read in next the characters until the next non-digit character or the end of the input is reached. The rest of the string is ignored.

4. Convert these digits into an integer (i.e. "123" -> 123, "0032" -> 32). If no digits were read, then the integer is 0. Change the sign as necessary (from step 2).
5. If the integer is out of the 32-bit signed integer range $[-231, 231 - 1]$, then clamp the integer so that it remains in the range. Specifically, integers less than -231 should be clamped to -231, and integers greater than $231 - 1$ should be clamped to $231 - 1$.
6. Return the integer as the final result.

Note:

- Only the space character ' ' is considered a whitespace character.
- Do not ignore any characters other than the leading whitespace or the rest of the string after the digits.

Example 1:

Input: s = "42"

Output: 42

Explanation: The underlined characters are what is read in, the caret is the current reader position.

Step 1: "42" (no characters read because there is no leading whitespace)

^

Step 2: "42" (no characters read because there is neither a '-' nor '+')

^

Step 3: "42" ("42" is read in)

^

The parsed integer is 42.

Since 42 is in the range $[-231, 231 - 1]$, the final result is 42.

Example 2:

Input: s = " -42"

Output: -42

Explanation:

Step 1: " _-42" (leading whitespace is read and ignored)

^

Step 2: " _42" ('-' is read, so the result should be negative)

^

Step 3: " _-42" ("42" is read in)

^

The parsed integer is -42.

Since -42 is in the range $[-231, 231 - 1]$, the final result is -42.

Example 3:

Input: s = "4193 with words"

Output: 4193

Explanation:

Step 1: "4193 with words" (no characters read because there is no leading whitespace)

^

Step 2: "4193 with words" (no characters read because there is neither a '-' nor '+')

^

Step 3: "4193 with words" ("4193" is read in; reading stops because the next character is a non-digit)

^

The parsed integer is 4193.

Since 4193 is in the range $[-231, 231 - 1]$, the final result is 4193.

Constraints:

- $0 \leq s.length \leq 200$
- s consists of English letters (lower-case and upper-case), digits (0-9), '-', '+', '.', and '!'.

9. Palindrome Number

Given an integer x , return `true` if x is a palindrome, and `false` otherwise.

Example 1:

Input: $x = 121$

Output: `true`

Explanation: 121 reads as 121 from left to right and from right to left.

Example 2:

Input: $x = -121$

Output: `false`

Explanation: From left to right, it reads -121. From right to left, it becomes 121-.

Therefore it is not a palindrome.

Example 3:

Input: $x = 10$

Output: `false`

Explanation: Reads 01 from right to left. Therefore it is not a palindrome.

Constraints:

- $-231 \leq x \leq 231 - 1$

10. Regular Expression Matching

Given an input string s and a pattern p , implement regular expression matching with support for '.' and '*' where:

- '.' Matches any single character.
- '*' Matches zero or more of the preceding element.

The matching should cover the entire input string (not partial).

Example 1:

Input: $s = "aa"$, $p = "a"$

Output: `false`

Explanation: "a" does not match the entire string "aa".

Example 2:

Input: $s = "aa"$, $p = "a*"$

Output: `true`

Explanation: '*' means zero or more of the preceding element, 'a'. Therefore, by repeating 'a' once, it becomes "aa".

Example 3:

Input: `s = "ab"`, `p = ".*"`

Output: true

Explanation: ".*" means "zero or more (*) of any character (.)".

Constraints:

- `1 <= s.length <= 20`
- `1 <= p.length <= 30`
- `s` contains only lowercase English letters.
- `p` contains only lowercase English letters, '.', and '*'.
- It is guaranteed for each appearance of the character '*', there will be a previous valid character to match.

11. Container With Most Water

You are given an integer array `height` of length `n`. There are `n` vertical lines drawn such that the two endpoints of the `i`th line are `(i, 0)` and `(i, height[i])`.

Find two lines that together with the x-axis form a container, such that the container contains the most water.

Return *the maximum amount of water a container can store*.

Notice that you may not slant the container.

Example 1:

Input: `height = [1,8,6,2,5,4,8,3,7]`

Output: 49

Explanation: The above vertical lines are represented by array `[1,8,6,2,5,4,8,3,7]`.

In this case, the max area of water (blue section) the container can contain is 49.

Example 2:

Input: `height = [1,1]`

Output: 1

Constraints:

- `n == height.length`
- `2 <= n <= 105`
- `0 <= height[i] <= 104`

12. Integer to Roman

Roman numerals are represented by seven different symbols: I, V, X, L, C, D and M.

Symbol	Value
--------	-------

I	1
V	5
X	10
L	50
C	100
D	500
M	1000

For example, 2 is written as II in Roman numeral, just two one's added together. 12 is written as XII, which is simply X + II. The number 27 is written as XXVII, which is XX + V + II.

Roman numerals are usually written largest to smallest from left to right. However, the numeral for four is not IIII. Instead, the number four is written as IV. Because the one is before the five we subtract it making four. The same principle applies to the number nine, which is written as IX. There are six instances where subtraction is used:

- I can be placed before V (5) and X (10) to make 4 and 9.
- X can be placed before L (50) and C (100) to make 40 and 90.
- C can be placed before D (500) and M (1000) to make 400 and 900.

Given an integer, convert it to a roman numeral.

Example 1:

Input: num = 3

Output: "III"

Explanation: 3 is represented as 3 ones.

Example 2:

Input: num = 58

Output: "LVIII"

Explanation: L = 50, V = 5, III = 3.

Example 3:

Input: num = 1994

Output: "MCMXCIV"

Explanation: M = 1000, CM = 900, XC = 90 and IV = 4.

Constraints:

- $1 \leq \text{num} \leq 3999$

13. Roman to Integer

Roman numerals are represented by seven different symbols: I, V, X, L, C, D and M.

Symbol	Value
--------	-------

I	1
V	5
X	10

L	50
C	100
D	500
M	1000

For example, 2 is written as **II** in Roman numeral, just two ones added together. 12 is written as **XII**, which is simply **X + II**. The number 27 is written as **XXVII**, which is **XX + V + II**.

Roman numerals are usually written largest to smallest from left to right. However, the numeral for four is not **IIII**. Instead, the number four is written as **IV**. Because the one is before the five we subtract it making four. The same principle applies to the number nine, which is written as **IX**. There are six instances where subtraction is used:

- **I** can be placed before **V** (5) and **X** (10) to make 4 and 9.
- **X** can be placed before **L** (50) and **C** (100) to make 40 and 90.
- **C** can be placed before **D** (500) and **M** (1000) to make 400 and 900.

Given a roman numeral, convert it to an integer.

Example 1:

Input: s = "III"

Output: 3

Explanation: III = 3.

Example 2:

Input: s = "LVIII"

Output: 58

Explanation: L = 50, V = 5, III = 3.

Example 3:

Input: s = "MCMXCIV"

Output: 1994

Explanation: M = 1000, CM = 900, XC = 90 and IV = 4.

Constraints:

- $1 \leq s.length \leq 15$
- s contains only the characters ('I', 'V', 'X', 'L', 'C', 'D', 'M').
- It is guaranteed that s is a valid roman numeral in the range [1, 3999].

14. Longest Common Prefix

Write a function to find the longest common prefix string amongst an array of strings. If there is no common prefix, return an empty string "".

Example 1:

Input: strs = ["flower", "flow", "flight"]

Output: "fl"

Example 2:

Input: strs = ["dog", "racecar", "car"]

Output: ""

Explanation: There is no common prefix among the input strings.

Constraints:

- $1 \leq \text{strs.length} \leq 200$
- $0 \leq \text{strs}[i].\text{length} \leq 200$
- $\text{strs}[i]$ consists of only lowercase English letters.

15. 3Sum

Given an integer array `nums`, return all the triplets $[\text{nums}[i], \text{nums}[j], \text{nums}[k]]$ such that $i \neq j$, $i \neq k$, and $j \neq k$, and $\text{nums}[i] + \text{nums}[j] + \text{nums}[k] == 0$.

Notice that the solution set must not contain duplicate triplets.

Example 1:

Input: `nums = [-1,0,1,2,-1,-4]`

Output: `[[-1,-1,2],[-1,0,1]]`

Explanation:

$\text{nums}[0] + \text{nums}[1] + \text{nums}[2] = (-1) + 0 + 1 = 0$.

$\text{nums}[1] + \text{nums}[2] + \text{nums}[4] = 0 + 1 + (-1) = 0$.

$\text{nums}[0] + \text{nums}[3] + \text{nums}[4] = (-1) + 2 + (-1) = 0$.

The distinct triplets are `[-1,0,1]` and `[-1,-1,2]`.

Notice that the order of the output and the order of the triplets does not matter.

Example 2:

Input: `nums = [0,1,1]`

Output: `[]`

Explanation: The only possible triplet does not sum up to 0.

Example 3:

Input: `nums = [0,0,0]`

Output: `[[0,0,0]]`

Explanation: The only possible triplet sums up to 0.

Constraints:

- $3 \leq \text{nums.length} \leq 3000$
- $-105 \leq \text{nums}[i] \leq 105$

16. 3Sum Closest

Given an integer array `nums` of length `n` and an integer `target`, find three integers in `nums` such that the sum is closest to `target`.

Return *the sum of the three integers*.

You may assume that each input would have exactly one solution.

Example 1:

Input: `nums = [-1,2,1,-4]`, `target = 1`

Output: 2

Explanation: The sum that is closest to the target is 2. $(-1 + 2 + 1 = 2)$.

Example 2:

Input: nums = [0,0,0], target = 1

Output: 0

Explanation: The sum that is closest to the target is 0. (0 + 0 + 0 = 0).

Constraints:

- $3 \leq \text{nums.length} \leq 500$
- $-1000 \leq \text{nums}[i] \leq 1000$
- $-104 \leq \text{target} \leq 104$

17. Letter Combinations of a Phone Number

Given a string containing digits from 2-9 inclusive, return all possible letter combinations that the number could represent. Return the answer in any order.

A mapping of digits to letters (just like on the telephone buttons) is given below. Note that 1 does not map to any letters.

Example 1:

Input: digits = "23"

Output: ["ad", "ae", "af", "bd", "be", "bf", "cd", "ce", "cf"]

Example 2:

Input: digits = ""

Output: []

Example 3:

Input: digits = "2"

Output: ["a", "b", "c"]

Constraints:

- $0 \leq \text{digits.length} \leq 4$
- $\text{digits}[i]$ is a digit in the range ['2', '9'].

18. 4Sum

Given an array nums of n integers, return an array of all the unique quadruplets [nums[a], nums[b], nums[c], nums[d]] such that:

- $0 \leq a, b, c, d < n$
- a, b, c, and d are distinct.
- $\text{nums}[a] + \text{nums}[b] + \text{nums}[c] + \text{nums}[d] == \text{target}$

You may return the answer in any order.

Example 1:

Input: `nums = [1,0,-1,0,-2,2]`, `target = 0`

Output: `[[-2,-1,1,2],[-2,0,0,2],[-1,0,0,1]]`

Example 2:

Input: `nums = [2,2,2,2,2]`, `target = 8`

Output: `[[2,2,2,2]]`

Constraints:

- `1 <= nums.length <= 200`
- `-109 <= nums[i] <= 109`
- `-109 <= target <= 109`

19. Remove Nth Node From End of List

Given the `head` of a linked list, remove the `nth` node from the end of the list and return its `head`.

Example 1:

Input: `head = [1,2,3,4,5]`, `n = 2`

Output: `[1,2,3,5]`

Example 2:

Input: `head = [1]`, `n = 1`

Output: `[]`

Example 3:

Input: `head = [1,2]`, `n = 1`

Output: `[1]`

Constraints:

- The number of nodes in the list is `sz`.
- `1 <= sz <= 30`
- `0 <= Node.val <= 100`
- `1 <= n <= sz`

20. Valid Parentheses

Given a string `s` containing just the characters '(', ')', '{', '}', '[' and ']', determine if the input string is valid.

An input string is valid if:

1. Open brackets must be closed by the same type of brackets.
2. Open brackets must be closed in the correct order.
3. Every close bracket has a corresponding open bracket of the same type.

Example 1:

Input: `s = "()"`

Output: `true`

Example 2:

Input: `s = "()[]{}"`

Output: `true`

Example 3:

Input: `s = "("`

Output: `false`

Constraints:

- `1 <= s.length <= 104`
- `s` consists of parentheses only `'()[]{}'`.
